APE London Website: Project Spec

Sep 29, 2026 · @Arisha

Overview

APE London's new site lets a customer choose a garment, design it, see the price update live, then order and pay without talking to anyone . It replaces the current site at sustainabletshirts.co.uk (final domain to be confirmed).

What we are building

- A marketing site: Home, Services, Our Work, Sustainability, About, Contact, legal pages.
- A garment catalogue: a hub, category pages and one page per garment, under APE's own garment names.
- Quick quote: an instant price on every garment page and on /get-a-quote.
- The order builder: a full-screen configurator where the garment on screen changes as the customer picks colour, artwork, text and positions.
- Cart, checkout and card payment, customer accounts, and an online proof approval step before production.
- An admin area so APE can manage garments, prices, orders and proofs.

Goals

- A customer can price and pay for a standard job with no phone call or email.
- Every order reaches the studio as a complete production brief: garment, sizes, positions, measurements, ink colours and original files.
- The same build shows the same price everywhere: quick quote, builder, cart, checkout and invoice.
- APE can change prices, garments and colours without a developer.
- Google Ads and organic search conversions are tracked from launch day.

How to read this spec

- **MUST** = required for launch. **SHOULD** = expected unless agreed otherwise in writing. **Phase 2** = not in launch.
- Anything marked *example* (prices, collections, garment names, thresholds) is placeholder until the client confirms it.

- Anything not written here is not in scope. Developers raise gaps before estimating, not after.
- Reference build: the order builder prototype already proves the recolouring, print placement, pricing logic and rules. Developers should reuse its logic rather than rebuild it. It uses example data only.

Decisions log

Decisions are grouped in the order a customer meets them, and each group explains its idea before asking anything about it. 5 are locked, 11 are proposed by Big Ladder and 22 are pending with the client. Update the status here as answers arrive.

1. How customers buy

Customers build an order on the site, pay by card and get their garments. Everything below is about that basic model.

Decision	Status	Owner	What it affects
Customers order and pay online	Locked	Client	Checkout, payment, invoices, emails
Customer accounts at launch	Locked	Client	Login, order history, reorder, saved designs
Sign-up required before payment, built into the checkout contact step	Locked	Client	Checkout
Designs are saved in the browser before sign-up and moved to the account at sign-up	Proposed	Client	Builder, saved designs
Prices shown excluding VAT by default, with an inc VAT switch	Proposed	Client	Every price display
Service method child pages move to phase 2	Locked	Client	Sitemap, SEO plan
Deadline moves; design is delivered first, then the build starts	Locked	Big Ladder	Schedule

2. How the site is built

A custom build means the site is written from scratch rather than on a shop platform like Shopify. Checkout, accounts, invoices and admin, which a platform gives for free, are all built by the developers, and the Effort estimate uses the custom-build figures.

Decision	Status	Owner	What it affects
Custom build	Locked	Client + developers	Effort, cost, hosting, security
Domain: stay on sustainabletshirts.co.uk or move to apelondon.com	Pending	Client	SEO, redirects, email setup

3. The garment range

APE offers a very wide range, so garments are loaded from supplier data rather than typed in by hand. Each garment is then prepared for the builder at one of three levels:

- **Hero**: the real photo, recoloured into any colour. About an hour of work per garment, for best sellers.
- **Auto**: the supplier's photo is processed automatically, and print positions come from a template for its shape (tee, hoodie, crew, polo, tote). A 5-minute check per garment.
- **Illustration**: a drawn outline of the shape in the chosen colour, for garments whose photos don't work. No photo work.

All three use the same builder and the same prices; only how realistic the preview looks changes. Products the builder can't make at all are quote-only and go to the enquiry form.

Decision	Status	Owner	What it affects
Range loaded from supplier data feeds (Ralawise; AS Colour to be checked)	Proposed	Client + developers	Catalogue, pricing, effort
Which products are in the range: APE's own chosen list, not a supplier's whole catalogue	Pending	Client	Catalogue size, SEO, admin
Which garments are Hero (proposed: the 20 to 30 best sellers)	Pending	Client	Photography, preparation time
Every other garment prepared at the Auto level, falling back to Illustration	Proposed	Big Ladder	Builder, effort
Which products are quote-only	Pending	Client	Catalogue, enquiry form

What if

- A supplier has no data feed (possibly AS Colour): its garments are added by hand in admin, or kept quote-only.
- A garment's supplier photo is missing, low quality or on a model in a complex pose: it drops to the Illustration level.

- A supplier discontinues a style: its page redirects to the category, and the studio contacts anyone with it in a saved design.
- A supplier changes its prices: APE's prices follow automatically only if garment pricing is cost × margin (see group 7).

4. Garment names

APE doesn't want supplier names shown. With a few hundred garments, names need a rule rather than being written one by one. The options are: brand names for every garment (not realistic at this size), descriptive names for every garment ("Heavyweight Organic Tee, 220gsm"), brand names for Hero garments and descriptive names for the rest, or supplier names.

Decision	Status	Owner	What it affects
Naming rule (proposed: brand names for Hero garments, descriptive names for the rest)	Pending	Arisha + client	Catalogue, SEO, admin
Garments relabelled, or shipped with supplier neck labels	Pending	Client	Photography, product copy
Written permission to use supplier photos under APE's names	Pending	Client	Photography, legal

What if

- Garments ship with the supplier's neck label: customers see the supplier name anyway, so hiding it on the site only goes so far.
- Customers search Google for a supplier style name ("Stanley Stella Creator"): with names hidden, the site won't rank for those searches.
- Two suppliers make a near-identical garment: one APE name could cover both, with APE choosing the supplier per order. Only possible if their size charts match; client to confirm they want this.
- A supplier photo shows the supplier's logo or label: it needs retouching, or APE's own photo.

5. Collections

APE sorts garments into Essential, Standard and Premium. The question is whether a collection is a filter (each garment belongs to one) or a switch (each style has an equivalent in all three).

Decision	Status	Owner	What it affects
Collections work as a filter or a switch	Pending	Client	Catalogue filters, builder garment step

What if: the client picks switch. APE then has to choose an equivalent for every style in every collection, and keep those pairings up to date as suppliers change.

6. Garment colours

Garment colour is the fabric colour the customer picks. To show it on screen, the builder needs a colour value (a hex code such as #1F2A44) for every colour of every garment. Supplier data usually gives only a name and a code, so the value has to come from somewhere.

Proposed: the software reads each colour's value from the supplier's own photo of that colour (the average colour of the fabric), and APE staff check the result in admin. A colour with no supplier photo is set by hand from the supplier's colour card.

Decision	Status	Owner	What it affects
Colour values read from supplier colour photos, checked by staff	Proposed	Big Ladder + developers	Builder, admin
Which colours are offered per garment and per collection	Pending	Client	Colour step, catalogue
Does APE send physical colour swatches or samples on request	Pending	Client	Garment page, FAQ

What if

- Screens show colours differently: every preview is close, never exact. The colour step and the terms say so.
- The same colour name differs between suppliers (one brand's Navy isn't another's): colours are stored per garment, not as one shared list.

- Heather, marl, camo, tie-dye or two-tone colours can't be recoloured: they need the supplier's photo of that colour, otherwise they aren't offered in the builder.
- A colour only comes in some sizes: the Sizes step blocks those sizes and says why. This needs size-by-colour data from the feed.
- A colour is out of stock: phase 2 (live stock). Until then, the studio contacts the customer after the order.

7. Pricing

The pricing engine can't show a real price until APE supplies its numbers. This group blocks launch.

Decision	Status	Owner	What it affects
APE's price tables, and who updates them	Pending	Client	Pricing engine; **blocks launch**
Garment price = supplier cost from the feed × APE's margin by quantity band	Proposed	Client	Pricing engine, admin
Minimum order (example: 6 pieces) and minimum per method	Pending	Client	Pricing, validation
Setup fees shown separately or included in the price per piece	Pending	Client	Price display, invoices
Large-order threshold for hand pricing (example: £2,500)	Pending	Client	Builder, quick quote, checkout
Same artwork on two garments: setup charged once or twice	Pending	Client	Pricing engine

8. Print colours (inks and threads)

Print colours are different from garment colours: they are the inks or threads APE prints or stitches with. For screen print and embroidery, the price depends on how many print colours a design uses. The builder reads the customer's logo and counts its colours. It can also go one step further and match each colour to the nearest ink or thread APE stocks, warning the customer when the match is poor.

Two options:

- **Count only (proposed for launch)**: the builder counts colours for the price and shows them. Customers can add Pantone codes in the notes, and the studio confirms on the proof. APE only needs to tell us its colour limits.
- **Count and match**: needs APE's list of stock inks with a Pantone code each, and the brand of thread it uses (thread brands such as Madeira publish their shade codes). APE doesn't need to measure anything if it gives us codes; only custom-mixed inks would need measuring.

Decision	Status	Owner	What it affects
Count only at launch; matching added later if APE supplies its ink and thread list	Proposed	Client	Builder design step, warnings
Does APE mix any Pantone on request, and does it cost extra	Pending	Client	Pricing, builder copy

What if

- The logo has gradients or is a photo: it counts as full colour, and the builder suggests DTF or DTG.
- Soft edges on a logo create near-identical shades: the builder merges them so they aren't counted as extra colours, and the studio confirms the final count on the proof.
- A dark garment needs a white base layer under the print: whether it counts as a colour is already asked in the client questionnaire.

9. Proof approval

After payment, the studio sends a proof: a picture showing exactly how and where the print will look. Production starts only when the customer approves it.

Proposed: an email with a button that opens a proof page on the site. No sign-in is needed, because the link is secure and tied to that order. The page shows the proof, the order summary and two buttons: Approve, and Request changes (with a comment box). The same proof also sits in the customer's account. The approval is recorded (who, which version, when) and moves the order into production automatically.

The cheaper alternative is approval by replying to the email, with the studio marking the order approved by hand. It saves about 5 to 10 developer-days, but replies get missed, there's no reliable record if a customer disputes a print, and dispatch dates don't update

by themselves.

Decision	Status	Owner	What it affects
Payment taken at checkout; production starts only after the proof is approved	Proposed	Client	Order workflow, refunds
Approval on a proof page (link in the email and in the account)	Proposed	Client	Order workflow, emails, effort
Reminder emails after 2 and 5 working days without a decision	Proposed	Client	Emails
Studio places artwork exactly as the customer set it, or can adjust it on the proof	Pending	Client	Builder copy, proof flow

What if

- The customer never replies: after the reminders, the studio calls. How long before the order is cancelled and refunded needs a client rule.
- The customer approves a proof with their own typo: the terms say an approved proof is final.
- Someone else at the customer's company must approve: anyone with the forwarded link can approve, and the page asks for their name, which is recorded.

10. Checkout and delivery

Decision	Status	Owner	What it affects
Invoice or purchase-order payment for business customers (proposed for phase 2)	Pending	Client	Checkout
Delivery charges, couriers, UK only or wider	Pending	Client	Checkout, delivery step
Daily cut-off time for counting working days	Pending	Client	Delivery dates

11. Everything else

Decision	Status	Owner	What it affects
Where quotes and enquiries go (email or a CRM)	Pending	Client	Integrations
Print & Go linked from the new site	Pending	Client	Navigation

Scope and phases

Phase 1 is a working shop for about 12 garments: catalogue, quick quote, builder, checkout, accounts and proofing. Everything else waits for phase 2.

Phase 1 (launch)

- Pages: Home, Services, Garments hub, category pages, garment pages, Get a quote, Order builder, Cart, Checkout, Account, Our Work with case studies, Sustainability, About, Contact, FAQ, legal pages, 404.
- Pricing engine on the server, with an admin screen for price tables.
- Quick quote on garment pages and /get-a-quote, plus an enquiry form for anything the builder can't do.
- Full garment range loaded from supplier data. Every garment is in the builder at one of three preparation levels (Hero, Auto, Illustration); quote-only products go to the enquiry form.
- Cart with more than one build per order, checkout, card payment, VAT invoices.
- Proof approval flow and the production sheet for the studio.
- Transactional emails.
- Admin: garments, colours, prices, rules, orders, proofs, content.
- Analytics, Google Ads conversion tracking, cookie consent.
- Technical SEO and a 301 redirect map from every old URL.
- Customer accounts (required to pay): order history, invoice download, proof approval, reorder, saved designs.

Phase 2

- Service method child pages (/services/screen-printing and so on).
- Share links for builds (send a build to a colleague).
- Invoice and purchase-order payment for business customers.

- Names and numbers per garment (team kit).
- More garments moved up to the Hero level.
- Sector pages (hospitality, construction, film and TV, events, education).
- Live stock from suppliers.
- Discount codes, abandoned basket emails.

Out of scope

- 3D garment previews and AI-generated photography.
- Automatic redrawing of low-quality artwork (a person does this).
- Automatic embroidery digitising (a person does this).
- Free placement by dragging artwork anywhere on the garment (customers choose a fixed position and a size).
- Payment on delivery, multi-currency pricing.
- Heather or marl colours without their own real photos.

Sitemap and URLs

The site has 16 page types at launch. The garment catalogue is the main SEO asset, and the builder, cart, checkout and account pages are kept out of search results.

Page	URL	In search results	Phase	Purpose
Home	/	Yes	1	Brand, trust, routes into garments and the builder
Garments hub	/garments	Yes	1	Every garment, with filters
Category	/garments/{category} e.g. /garments/t-shirts	Yes	1	Ranks for "custom printed t-shirts" and similar

Page	URL	In search results	Phase	Purpose
Garment page	/garments/{category}/{garment} e.g. /garments/t-shirts/{ape-name}	Yes	1	Photos, colours, sizes, specs, quick quote, Start your order
Services	/services	Yes	1	Decoration methods and what each suits
Service method	/services/{method} e.g. /services/embroidery	Yes	2	Ranks for "embroidery london" and similar
Get a quote	/get-a-quote	Yes	1	Quick quote with a garment picker, and the enquiry form
Order builder	/start-your-order?garment={garment}	No	1	The configurator
Cart and checkout	/cart, /checkout	No	1	Payment
Account	/account, /account/orders, /account/orders/{ref}, /account/saved	No	1	Orders, proofs, invoices, reorder, saved designs
Our Work	/our-work, /our-work/{case-study}	Yes	1	Proof and long-tail search
Sustainability	/sustainability	Yes	1	Evidence-backed claims only
About	/about	Yes	1	Story, facility, team
Contact	/contact	Yes	1	Must match the Google Business Profile exactly

Page	URL	In search results	Phase	Purpose
FAQ	/faq	Yes	1	Minimums, turnaround, artwork, delivery, returns
Legal	/terms, /privacy, /cookies, /delivery-and-returns	Yes	1	Terms of sale, personalised-goods policy, misprints

Rules

- URLs are lowercase, hyphenated and final at launch. A later change needs a 301 redirect.
- Every old URL on the current site that has traffic or links gets a 301 to its closest new page. The SEO lead supplies the crawl and signs off the redirect map before launch.
- A discontinued garment's page 301s to its category page. It is never deleted without a redirect.
- Builder, cart, checkout and account pages carry noindex. /get-a-quote is the indexable page for quote searches.

Garment data model

One garment record feeds the garment page, quick quote, the builder, the cart and the production sheet. If a field isn't in this record, no feature can use it, so this is the backbone of the build.

Garment record

Field	Example	Used by
Display name (APE's own) and URL slug	example: "Heavy Tee"	Everywhere customers see
Supplier, supplier code	Ralawise, STTU171	Admin and production sheet only, if names are APE's own

Field	Example	Used by
Category	T-shirts	Catalogue, filters
Collection	Standard	Catalogue, builder
Equivalent styles in other collections	only if the client picks "switch"	Builder garment step
Short and long description	original copy, not supplier copy	Garment page, SEO
Fabric, weight, fit	100% cotton, 220 gsm, relaxed	Garment page, cards
Sizes offered, size chart in cm and inches	XS to 3XL, chest and length	Garment page, sizes step
Colours offered, per collection	list of colour ids	Colour step, swatches
Which colours have a real photo	Sage	Colour step label (real vs simulated)
Photos per view	front, back, on model	Garment page gallery
Builder images per view	cut-out photo, detail map, fixed layer	Builder recolouring
Print positions per view	centre, anchor, rotation, largest size in inches, pixels per inch	Builder, quick quote, production sheet
Methods allowed, overall and per position	screen, embroidery, DTF, DTG	Builder, quick quote
Minimum order	6 (example)	Validation
Price bands and size surcharges	see Pricing engine	Pricing engine
Flags	preparation level (Hero, Auto, Illustration), quote-only, live, discontinued	Catalogue, routing
Sustainability claims with evidence file and expiry date	certificate PDF	Garment page, Sustainability page

Field	Example	Used by
SEO title and meta description		Garment page

Shared records

- **Colour**: stored per garment, since the same colour name differs between suppliers: name, hex (read from the supplier's photo of that colour and checked by staff), colour family (for grouping and search), supplier colour code, sizes it comes in, heather flag.
- **Method**: name, minimum quantity, what is counted (inks, threads, full colour), largest and smallest size, allowed positions, lead time.
- **Position**: name (Front, Back, Left chest, Right chest, Left sleeve, Right sleeve), view, the point it is measured from (for example, centred, 3 in below the collar seam), default largest size.
- **Rule**: a combination that is blocked and the reason shown to the customer, for example front print and chest logo overlap, script font can't be stitched, rush not offered for embroidery.

Adding a garment to the builder (MUST be documented by the developers)

1. Shoot or source flat photos, front and back, on a plain white background, at least 2,000 px tall.
2. Run the image preparation script to produce the cut-out, detail map and fixed layer.
3. Set the print positions and check each sits on the fabric.
4. Check the recolouring on 8 test colours, light to dark.
5. Enter data and prices, set live.

That is the Hero level: 1 to 2 hours per garment once the process exists. At the Auto level, steps 2 and 3 run automatically on the supplier's photos, with print positions fitted from a template for the garment's shape (tee, hoodie, crew, polo, tote and so on), leaving a 5-minute check. At the Illustration level, the builder uses a drawn outline of the shape, recoloured, with no photo work. Quote-only products skip the builder.

Pricing engine

One pricing engine on the server prices every build. Quick quote, the builder, the cart, checkout and the invoice all ask it, so a build never shows two prices.

Inputs

- Garment, collection and colour (dark garments may cost more to print, for example a white base layer on screen print).
- Total quantity and the split by size.
- Method, and for each position: size, and colour count (inks or threads) or print area (full-colour methods).
- Delivery speed and delivery destination.

Price parts (each rule comes from APE's tables; the numbers in the prototype are examples)

Part	How it's priced (example structure)
Garment	Supplier cost from the feed × APE's margin by quantity band (proposed), or APE's own price table
Screen print	Per colour per position by quantity band, plus a screen setup fee per colour
Embroidery	By design size or stitch count band, plus a digitising fee per design
DTF and DTG	By print area band per position
Larger sizes	Surcharge per piece, for example 2XL and 3XL
Delivery speed	Standard included; Express and Rush add a percentage
Delivery charge	To be set by the client (flat rate, by weight or by value)
VAT	20% on the total

Rules

- **MUST** run on the server. The browser only shows the result. Checkout recalculates everything and ignores any price sent from the browser.
- **MUST** calculate in pence. The order total is the source of truth; the price per piece shown is the total divided by quantity, rounded to 2 decimal places. Invoice lines must add up to the total exactly.
- Returns: price per piece, total, a breakdown (garment, decoration, setup, size extras, delivery speed, delivery, VAT) and the next price break ("add 50 and pay £x each").

- Minimum order and each method's minimum are enforced here, not just in the interface.
- Above the large-order threshold (example £2,500), the engine returns "hand-priced" and checkout is not offered for that build.
- The same artwork on two garments in one order: whether setup fees are charged once or twice is a client decision.

Admin

- APE edits every table in admin, with a test calculator to check a price before saving.
- A change applies to new calculations immediately. A basket built before the change is repriced at checkout, with a message showing the old and new price.
- Every change is logged: who, when, old value, new value.
- Emailed quotes and saved designs show a "price valid until" date (the number of days is a client decision).

Content pages

Every content page has one H1, one primary call to action and a unique title and meta description. The primary call to action is "Start your order" unless stated otherwise. All copy, photos and client logos are supplied by the client or Big Ladder's content writer; the developers build the sections as reusable blocks editable in the CMS.

Page	Sections, in order
Home	Hero (proposition, Start your order, Browse garments) · client logos · featured garments (from the catalogue, live prices) · how it works in 4 steps (build, pay, approve proof, delivered) · decoration methods · why APE (in-house London studio, proof before production) · featured work · sustainability teaser · reviews · FAQ · closing call to action
Services	Intro · one block per method: what it suits, minimum, turnaround, example photo · artwork guidance (formats, resolution, embroidery digitising) · workwear and uniforms · wholesale and blanks · bespoke and specialist · FAQ · call to action

Page	Sections, in order
Get a quote	Hero with response time · quick quote with garment picker · enquiry form for anything else · what happens next · what affects your price · prefer to talk (phone, email)
Our Work	Intro · filters (sector, garment, method) · project grid · case study template: client, brief, garments, method, quantity, turnaround, photos, quote · call to action
Sustainability	Opening position · materials · production · certifications (only those with evidence) · waste and packaging · garments with evidence-backed claims · call to action
About	Story · facility with photos · capabilities in numbers · team · values · call to action
Contact	Details as text (match Google Business Profile) · short enquiry form · map, hours, directions · routing (new orders, existing orders, artwork)
FAQ	Grouped: ordering, pricing and minimums, artwork, proofs, delivery, returns and misprints
Legal	Terms of sale, privacy, cookies, delivery and returns

Rules

- **MUST**: every sustainability claim links to evidence held in admin. No "organic", "eco" or "sustainable" on a garment without its evidence file. UK green claims rules apply.
- **MUST**: terms state that personalised goods are exempt from the 14-day cancellation right, and set out the misprint and returns policy.
- **MUST**: reviews and testimonials are real and attributed. No invented quotes.
- FAQ blocks carry FAQ schema; the organisation and local business schema sit on every page.

Catalogue

The catalogue is where most customers start: a hub, a page per category and a page per garment. It shows only garments APE has chosen, never a supplier's full range.

Garments hub (/garments)

- Filters: category, collection, decoration method, colour family, evidence-backed sustainability. Filters update the URL so a filtered view can be shared.
- Sort: recommended (default), price low to high, newest.
- Card: photo, name, collection label, fabric weight, number of colours, "from £x each at 100 pieces" (from the pricing engine, one print position), Customise button.
- Quote-only garments show "Get a quote" instead of a price.
- Empty filter result: message plus a button to clear filters.

Category page

- H1 and 80 to 150 words of original copy at the top, longer copy and FAQ below the grid.
- Same grid and filters as the hub, filtered to the category.

Garment page

- Gallery: front, back, on model. Selecting a colour swatch recolours the main image using the builder's renderer (SHOULD), labelled "Simulated colour" when it isn't the real photo.
- Name, collection, one-line description, fabric, weight, fit.
- Colour swatches grouped by family. Colours not offered in this collection don't appear.
- Sizes offered, with a size chart in cm and inches.
- Quick quote panel (see Quick quote).
- Primary button: Start your order, opening the builder with this garment and colour already chosen.
- Secondary link: Get a quote, for anything unusual.
- Details: decoration methods suited to this fabric, print positions with largest sizes, care, turnaround.
- Sustainability: claims with a link to evidence, only when the evidence exists.
- Related garments: same category, other collections.
- Structured data: Product with a price range. No review stars until real reviews exist.

States

- Quote-only garment: no builder button; the quick quote panel becomes the enquiry form with this garment filled in.
- Colour out of stock (phase 2, when stock data exists): swatch disabled with the reason.
- Discontinued: the page 301s to its category.
- Price unavailable (pricing service down): hide prices, show "Price shown in the builder" and log the error. Never show £0.00.

Quick quote

Quick quote gives a price in five inputs or fewer, using the same engine and rules as the builder. It is the short way into the same order, not a separate system.

Where it appears

- On every garment page, as a panel beside the gallery.
- On /get-a-quote, with a garment picker as the first input.

Inputs

1. Quantity: chips (25, 50, 100, 250, 500+) and a number box.
2. Method: screen print, embroidery, DTF, DTG. Blocked methods show the reason (for example "Screen print starts at 25 pieces").
3. Positions: tick one or more of Front, Back, Left chest, Right chest, Left sleeve, Right sleeve. Overlapping combinations are blocked with the reason.
4. Colours per position (screen print and embroidery only): 1 to 6, or "Not sure" (priced at 2, labelled as an estimate).

Delivery defaults to Standard; speed is chosen in the builder.

Output

- Price per piece and total, ex VAT by default, following the site-wide VAT switch.
- Next price break: "Add 50 and pay £x each".
- Note: "Based on a typical size mix. 2XL and above cost extra."
- Above the large-order threshold: no price; the message "Orders this size are priced by a person" and the enquiry form, pre-filled.

Actions

- **Customise and order** (primary): opens the builder with every quick quote choice carried over.
- **Email me this quote**: asks for an email address, with a separate unticked box for marketing consent. Sends the quote with a link that reopens it in the builder, and a "valid until" date.
- **Talk to us**: phone and email.

Enquiry form (on /get-a-quote, and for quote-only garments)

- Fields: name, company (optional), email, phone (optional), product type (including items not in the catalogue), quantity, needed-by date, decoration, artwork upload (several files), notes, marketing consent (separate, unticked).
- File limits: to be confirmed with the developers; proposed 50 MB per file, 5 files.
- On send: thank-you screen with a reference number and the promised response time; auto-reply email; a copy goes to the quote inbox or CRM.

Order builder

The builder is a one-screen configurator in six steps, with the garment on screen updating live and the price always visible. The prototype is the reference for layout, behaviour and rules; this section is what must be true in production.

Layout (desktop)

- Black top bar: logo, "Build your order", ex/inc VAT switch, Save, Share (phase 2).
- Left rail: the six steps with icons; a dot marks steps visited. Any step can be opened at any time.
- Stage: the garment, Front/Back switch, a spec line (collection, garment, colour, method, positions), a price pill docked at the bottom.
- Right panel: step title, step content, a collapsible "Your build" summary, Back and Next.

Layout (phone): top bar, stage (about 60% of screen height), steps as a horizontal row, panel below, price pill fixed to the bottom of the screen. No horizontal scrolling at 360 px wide.

Price pill: quantity stepper, price label, total, price per piece. The label reads "Example at 50" before a quantity is chosen, "Your price" after, and "Indicative price" above the large-order threshold. Once sizes are entered, the stepper becomes "{n} pcs · Edit sizes" and opens the Sizes step, because the size grid is then the source of truth.

Steps

1. **Quantity**: chips 10, 25, 50, 100, 250, 500+, a number box, and "Not sure yet" (shows an example price at 50). Shows price per piece and total.
2. **Garments**: collection control (filter or switch, per the client's decision), category chips, cards with photo, name, spec and price at the chosen quantity. Garments not in the chosen collection are shown disabled with the reason.
3. **Colour**: swatches grouped by family, search by name or family, a "Real photo", "Simulated" or "Illustration" label, unavailable colours crossed out with the reason and the nearest alternative.
4. **Design**: method cards with price per piece and a "Best price" badge on the cheapest, then one card per position: choose position, upload artwork or add text, size slider (min and max from the method and position), a real-world size hint ("about the size of an A4 sheet"), "Add another position".
5. **Sizes**: suggested split of the quantity (editable), size surcharges shown next to each size, and a price-break table for this build. Checkout needs exact sizes, so "Confirm sizes later" is removed unless the client asks for it.
6. **Delivery**: "When do you need it by?" date picker. Each speed shows "In time" or "Too late", with the cheapest option that arrives in time selected. Without a date, Standard is selected.

Then **Review**: preview of each view, every choice with an Edit link, price breakdown, Add to basket.

Artwork

- Accepted: PNG, JPG, SVG, PDF, AI, EPS, TIFF, HEIC, WebP. PDF, AI and EPS are converted on the server for the preview; if conversion fails, a labelled placeholder box shows the space and the studio checks the file.
- The original file is always kept for production. Background removal and colour matching are for the preview only.
- A plain white background is removed for the preview, with a message saying so.
- For screen print and embroidery, the builder counts the artwork's colours, and the count sets the price. Matching each colour to APE's ink or thread list, with a warning on a poor match, is added only if APE supplies that list (Decisions log, group 8).
- Warnings: resolution below 150 DPI at the chosen size; photo-like artwork on screen print (with a one-tap switch to DTF); ink that will barely show on the garment colour.

Text: up to 28 characters, 5 fonts (Bold, Condensed, Serif, Varsity, Script), a fixed list of ink colours, same size slider. Script is blocked for embroidery. Embroidery enforces a minimum letter height.

Placement: customers pick a fixed position and a size, and cannot drag artwork freely. Each position is measured from a fixed point (for example, centred, 3 in below the collar seam), which the production sheet records. Whether the studio can adjust placement on the proof is a client decision, and the builder copy must say so.

Rules the builder enforces (all from admin, all with a visible reason)

- Front print and chest logo can't be combined (they overlap).
- Embroidery only on chest and sleeves, largest 4.5 in (example).
- Each method's minimum quantity.
- Rush not offered for embroidery or above 250 pieces (example).
- A method not offered on a collection (example: DTF on Premium).

Changes that break the build: when a change makes something invalid (a new garment, method or collection), the builder fixes it and says what it changed in one message, for example "Embroidery only goes on chest and sleeves, so we moved Front to left chest." It never drops a design silently.

States: garment images loading (placeholder, then fade in); image failed (message and retry); upload in progress; upload failed (reason and retry); pricing unavailable (hide price, disable Add to basket, retry); leaving with unsaved changes (confirm).

Saving: the top bar has Save and, when signed in, My designs. Save when signed out opens "Create an account to save your design" (email and password, or sign in). When they finish, they return to the same step with nothing lost. Before sign-up, the build is saved in the browser automatically and moved to the account at sign-up. The builder never asks for sign-up to open, show prices or upload artwork.

What goes into the basket: the full build as data, a preview image of each view, the original artwork files, and the price recalculated on the server.

Cart, checkout and payment

Customers pay by card at checkout, and nothing is produced until they approve a proof (proposed, client to confirm). Checkout recalculates every price on the server before taking payment.

Basket

- One line per build: preview image, garment, colour, method, positions, size breakdown, price per piece, line total.
- Actions per line: Edit (reopens the builder with that build), Duplicate (for the same design on another garment or colour), Remove.
- More than one build per order is allowed.
- Totals: subtotal, delivery, VAT, total; ex/inc VAT switch applies.
- A build above the large-order threshold can't be checked out; it shows the hand-priced quote route instead.
- Prices changed since the build was made: the new price shows with a one-line notice.

Checkout

1. Contact and account: name, email, phone, password (creates the account), company (optional), VAT number (optional), purchase order reference (optional). Returning customers sign in instead. There is no separate sign-up screen before checkout.
2. Delivery address with postcode lookup; billing address (same by default). UK only unless the client decides otherwise.
3. Delivery method and charge.
4. Confirmations (required, unticked by default): "I have the right to print this artwork" and acceptance of the terms, including that personalised goods can't be returned for a change of mind. Marketing consent is a separate, optional box.
5. Payment: card, Apple Pay, Google Pay through the platform's payment provider (for example Stripe or Shopify Payments). 3D Secure (Strong Customer Authentication) is required in the UK. Card details never touch APE's server.
6. Confirmation page: order reference, what happens next (artwork check, proof, production), and the confirmation email.

Payment rules

- Payment failed or cancelled: the customer returns to checkout with the basket intact and the reason shown.
- A VAT invoice is created for every paid order and downloadable from the account.
- Refunds, full or partial, are issued from admin and recorded on the order.
- A price change after the proof (for example extra ink colours) is handled by an extra payment link or a partial refund, both issued from admin.

Delivery dates

- Working days exclude weekends and UK bank holidays (England and Wales calendar, kept up to date).
- Orders after a daily cut-off time count from the next working day (the cut-off time is a client decision).
- Production days count from proof approval, not from payment. Every delivery date on the site says so.

Customer accounts

Accounts are required to pay. They let customers track orders, approve proofs, download invoices, reorder and keep saved designs.

Sign up and sign in

- Email and password. Password rules: at least 10 characters; no forced symbols.
- Email verification before first sign-in.
- Forgot password: emailed reset link, valid for 1 hour, single use.
- Repeated failed sign-ins are rate-limited.
- Sign-up is offered at three points: Save in the builder, the checkout contact step, and Email me this quote (optional there).
- Sign in with Google: phase 1

Account area

Page	What it shows	Actions
Orders	Reference, date, status, total	Open order
Order detail	Builds with previews, sizes, status timeline, proof, delivery tracking	Approve proof, request changes, download VAT invoice, reorder
Saved designs (/account/saved)	Front preview, garment and colour, quantity, price at today's prices with a "price changed" tag, last edited, when the artwork expires	Continue editing, add to basket, duplicate, rename, delete. Empty state: "No saved designs yet" with Start your order
Addresses	Saved delivery and billing addresses	Add, edit, delete, set default
Details	Name, email, phone, company, VAT number, marketing preference	Edit, change password, delete account

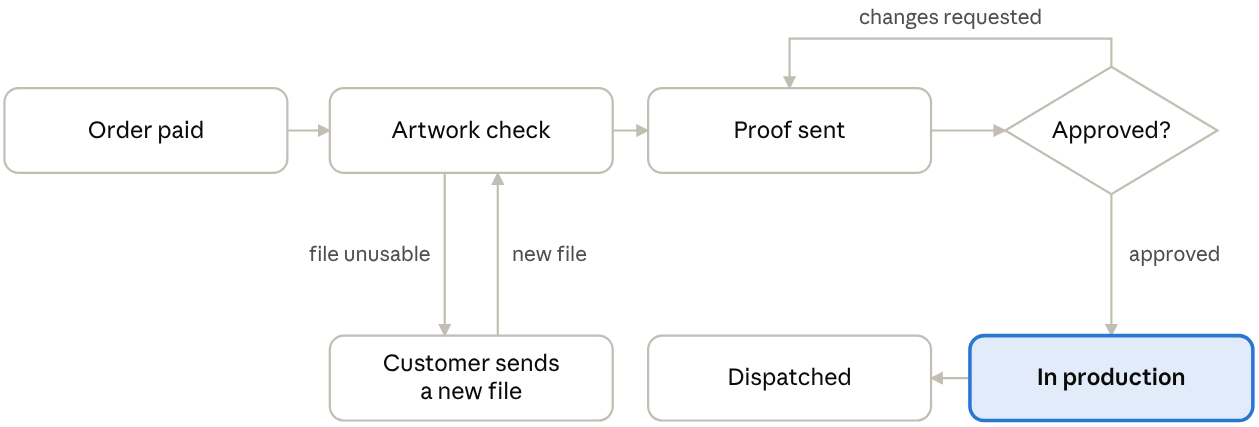

Rules

- Reorder copies the build into the builder at today's prices, with the original artwork. The customer can change sizes and quantity before adding to the basket.
- Delete account: removes personal data, keeps order records needed for tax (UK: 6 years) with personal details minimised.
- An emailed proof link lets a customer approve without signing in; it is signed, tied to that order and expires after the proof is decided.

Order workflow and proof approval

Every paid order goes through an artwork check and a proof, and the customer's approval is what starts production. No platform has this built in, so it is custom work and must be estimated as its own line.

Production starts only after the customer approves the proof

order workflow · 6 statuses, 2 loops

The customer can loop through "changes requested" as often as needed; each round is a new proof version.

Statuses (shown to the customer in their account and in emails)

Status	Who acts	What happens
Order paid	System	Order created, studio notified, production sheet generated
Artwork check	Studio	Files checked; if unusable, the customer is emailed with the reason and a secure upload link
Proof sent	Studio	Studio uploads a proof (PDF or image) per build; customer emailed
Changes requested	Customer	Customer writes what to change; studio sends a new proof version
In production	Studio	Starts on approval; the delivery date is recalculated from the approval date
Dispatched	Studio	Courier and tracking number added; customer emailed
Cancelled or refunded	Studio	Before production only, per the terms

Rules

- Approval records who approved, which proof version, date and time. It can't be undone by the customer.
- No response to a proof after 2 working days: reminder email (timing is a client decision). The delivery date moves with the delay, and the customer is told so.
- A proof that changes the price (for example more ink colours than detected) shows the new price; the customer pays the difference or receives a partial refund before production.

Production sheet (MUST, one PDF per build, downloadable from admin)

- Order reference, customer, company, promised dispatch date.
- Garment display name and supplier code, colour name and supplier colour code, size breakdown.
- Per position: position name, finished size in cm and inches, placement measured from its reference point, method, ink or thread colours with codes, font and text for text designs.
- Links to the original artwork files, the preview image of each view, customer notes.

Emails

The site sends 17 transactional emails at launch, all designed as branded templates with plain-text versions. Copy is written by Big Ladder and approved by the client.

Email	Sent when	To
Order confirmation with VAT invoice	Payment succeeds	Customer
New order	Payment succeeds	Studio
Artwork problem, with secure upload link	Studio marks artwork unusable	Customer
Proof ready, with approve and request-changes buttons	Studio uploads a proof	Customer
Proof reminder	No decision after 2 working days (example)	Customer
Proof approved, with confirmed dispatch date	Customer approves	Customer and studio

Email	Sent when	To
Changes requested	Customer requests changes	Studio
Price adjustment, with payment link or refund notice	Studio changes the price after the proof	Customer
Dispatched, with tracking	Studio adds tracking	Customer
Refund issued	Studio refunds	Customer
Your quick quote, with a link back to the builder	Customer asks to email a quote	Customer
Enquiry received, with reference	Enquiry form sent	Customer
New enquiry	Enquiry form sent	Quote inbox or CRM
Hand-priced quote request received	Build above the threshold is sent	Customer and account manager
Verify your email	Account created	Customer
Reset your password	Customer asks	Customer
Account deleted	Customer deletes the account	Customer

Rules

- Sent from the site's own domain, with SPF, DKIM and DMARC set up, so emails don't land in spam.
- Every customer email includes the order or quote reference and a way to contact the studio.
- Marketing emails are separate from these and only go to people who ticked the marketing box.

Admin for APE staff

APE staff must be able to run the shop day to day without a developer: change prices, add garments and colours, and move orders through proofing to dispatch.

Area	Staff can
Garments	Add, edit, hide, discontinue; upload photos and builder images; set print positions; set colours per collection; set methods allowed; preview the garment in the builder before going live
Colours	Maintain the master colour list: name, hex, family, supplier code, heather flag
Methods and rules	Set minimums, largest and smallest sizes, allowed positions, blocked combinations and the reason text
Ink and thread lists	Maintain the ink and thread colours used for matching, with codes
Price tables	Edit every table; test a build's price before saving; see the change log
Orders	List and filter by status and date; open an order; download the production sheet and original artwork; upload proofs; change status; add tracking; issue refunds and payment links; internal notes
Enquiries and quotes	List, assign to a person, mark handled (unless they go to a CRM)
Customers	View accounts, orders and saved designs; export or delete a customer's data on request
Content	Edit pages, case studies, FAQs, legal pages, homepage blocks, SEO titles and descriptions
Settings	Large-order threshold, delivery charges and speeds, cut-off time, bank holidays, email copy

Roles

- Admin: everything.
- Studio: orders, proofs and production sheets only; no prices, no customer data export.
- Content editor: pages and case studies only.

Rules

- Two-factor sign-in for every admin account.
- Every change to prices, rules and order status is logged with the person and time.

Integrations

The launch needs a payment provider, analytics with Google Ads conversion tracking, cookie consent, a transactional email service and file storage. The CRM, accounting, courier and supplier-feed integrations wait on client answers.

Integration	Phase	Requirement
Payments	1	Card, Apple Pay, Google Pay, 3D Secure; refunds from admin (Stripe or the platform's own)
Analytics	1	GA4 through Google Tag Manager, with the events below
Google Ads	1	Purchase conversion with order value; enquiry and quote-email conversions; enhanced conversions
Cookie consent	1	UK GDPR and PECR compliant banner; Google Consent Mode v2; nothing but essential cookies before consent
Transactional email	1	Platform's own or a service such as Postmark; SPF, DKIM, DMARC on the domain
File storage	1	Artwork stored privately (not public URLs), virus-scanned on upload, deleted after the retention period
Search Console	1	Verified, XML sitemap submitted, redirect monitoring after launch
CRM for enquiries	1 or 2	Client to name the system; email to a shared inbox as the fallback
Accounting	2	Client to name the system (for example Xero); orders and invoices exported
Courier	2	Client to name the courier; tracking added by hand in phase 1

Integration	Phase	Requirement
Supplier data feed	1 and 2	Ralawise feed: products, colours, sizes and cost prices at launch; live stock in phase 2. AS Colour to be checked

Analytics events (MUST, each with the garment, method and value where relevant)

- view_item (garment page), builder_start, builder_step (step name), design_uploaded, quick_quote_price_shown, quote_emailed, enquiry_submitted, add_to_cart, begin_checkout, purchase (value ex VAT, currency GBP), proof_approved, sign_up.
- The Google Ads account's current primary conversion (the lead form) must be replaced or kept by agreement before launch, so reporting doesn't break.

Non-functional requirements

These apply to every page and feature. They're measurable, so they double as test targets.

Area	Requirement
Speed (content and catalogue pages)	Core Web Vitals "good" on mobile: LCP under 2.5 s, INP under 200 ms, CLS under 0.1
Speed (builder)	First garment visible within 3 s on 4G; colour change under 100 ms after the first load; view switch under 300 ms
Browsers	Latest 2 versions of Chrome, Safari (macOS and iOS), Edge, Firefox, Samsung Internet
Screens	360 px to 1920 px wide; no horizontal scrolling
Accessibility	WCAG 2.2 AA: keyboard use throughout (including the builder), visible focus, labelled controls, 4.5:1 text contrast, reduced-motion respected, no drag-only actions

Area	Requirement
Security	HTTPS everywhere; prices recalculated on the server; uploads checked by file content, size-limited and virus-scanned; forms protected against spam (for example Cloudflare Turnstile); rate limiting on sign-in and forms; card data only in the payment provider's fields
Privacy	Privacy and cookie policies; artwork and personal data kept for a set period (client to decide), then deleted; export and delete on request; data processing agreements with every supplier of services
Technical SEO	Unique titles and meta descriptions; canonical tags; Organization, LocalBusiness, Product, FAQ and Breadcrumb schema; XML sitemap; noindex on builder, cart, checkout, account; image alt text; full 301 map from the old site
Reliability	Daily backups kept for 30 days; uptime monitoring; error logging with alerts; a staging site that mirrors live
Handover	Code in a repository the client owns; all accounts (hosting, domain, payment, analytics) in the client's name; written guide for adding garments and editing prices

Design handoff

The design is complete when every item below is delivered at desktop (1440 px), tablet (768 px) and phone (390 px). Anything not designed here is treated as a change after handoff.

Foundations

- [ ] Colour tokens (light and dark where used), type scale (Schibsted Grotesk, Instrument Serif), spacing, grid, radius, shadows

- [ ] Component library: buttons, inputs, selects, date picker, chips, segmented control, swatches, cards, price pill, stepper, slider, toasts, inline warnings, modals, tables, tabs, breadcrumbs, pagination, badges
- [ ] Icon set (steps, positions, methods, status)
- [ ] Header, footer and mobile menu

Pages

- [ ] Home, Services, Our Work, case study, Sustainability, About, Contact, FAQ, legal template, 404
- [ ] Garments hub, category page, garment page (buildable and quote-only versions)
- [ ] Get a quote: quick quote with garment picker, enquiry form, thank-you screen

Quick quote

- [ ] Default, price shown, blocked option with reason, above threshold, email-me-this-quote, error

Order builder

- [ ] Each of the 6 steps, plus Review
- [ ] Design step: empty position, artwork uploaded, text added, each warning (low resolution, poor colour match, photo-like art, low contrast), blocked position, placeholder for converted files
- [ ] Auto-fix message after a breaking change
- [ ] Loading, image failed, upload failed, pricing unavailable, leave-without-saving
- [ ] Above-threshold (hand-priced) state
- [ ] Phone layout for every step
- [ ] Save pop-up (sign up and sign in versions), and the builder top bar signed in with My designs
- [ ] Saved designs page: filled, empty, and price changed
- [ ] Illustration outlines for every garment shape in the range (about 10 to 15: tee, long sleeve, hoodie, zip hoodie, crew, polo, shirt, jacket, tote, cap and so on), front and back, with print positions marked
- [ ] Colour step labels for all three levels: Real photo, Simulated, Illustration
- [ ] Proof page: proof, order summary, Approve, Request changes, approver name

Commerce and account

- [ ] Basket (one and several builds, price-changed notice), checkout steps, payment failed, order confirmation
- [ ] Sign up, sign in, verify email, forgot and reset password
- [ ] Account: orders list, order detail with status timeline, proof approval and request changes, saved designs, addresses, details, delete account
- [ ] Emailed-proof approval page (no sign-in)

Other

- [ ] 17 email templates
- [ ] Cookie banner and preferences
- [ ] Production sheet layout (PDF)
- [ ] Annotations on every screen linking to the rule in this spec

Effort estimate

Target: phase 1 in **3 months with 2 developers**, one backend and one frontend. That is about 120 developer-days, tighter than the planning ranges below, so the team works to a fixed order and a fallback list is agreed up front.

- **Backend**: supplier feed, pricing engine, artwork storage and conversion, production sheet, checkout, payments and invoices, accounts, proof flow, emails, admin.
- **Frontend**: design system, content pages, catalogue, quick quote, the builder, basket and checkout screens, account screens, proof page, tracking.
- **If the plan is behind at week 6**, these move to phase 2 in this order: Illustration level (those garments go quote-only), Google sign-in, emailed quotes, the garment tool in admin (garments prepared by the documented manual process), Hero garments cut to 10.

The ranges below are Big Ladder's planning figures for one experienced developer, not a quote. Developers fill in their own column line by line, and any line they leave out is treated as not included.

Line item	Our range (days)	Developer estimate (days)	Notes
Content pages and CMS blocks	8–15		10 page templates

Line item	Our range (days)	Developer estimate (days)	Notes
Catalogue: hub, category, garment page, filters	12–18		Built from scratch on a custom build
Supplier data feed: import and daily sync	5–10		Products, colours, sizes, cost prices
Pricing engine and price table admin	8–15		Must run on the server
Order builder (production version)	20–35		Prototype logic reused
Automatic garment preparation and shape templates (Auto level)	6–10		Runs the image script on supplier photos
Illustration level in the builder	3–5		Drawn outlines supplied by design
Preparing Hero garments (20–30)	4–8		About 1.5 hours each, plus checks
Artwork upload, conversion and storage	4–8		PDF, AI, EPS previews; originals kept
Production sheet PDF	4–7		Often forgotten
Quick quote and emailed quotes	3–6		Needs the pricing engine first
Enquiry form	2–4		Uploads, auto-reply, inbox or CRM
Basket, checkout, payment, VAT invoices	10–15		Built from scratch on a custom build
Customer accounts, sign-up, Google sign-in, saved designs	10–15		Built from scratch on a custom build
Proof approval page and flow	5–10		Not built into any platform
Transactional emails (17)	3–5		

Line item	Our range (days)	Developer estimate (days)	Notes
Garment tool in admin: images and print positions	3–6		Checking and correcting the Auto level
Other admin: orders, customers, rules, settings, roles	8–12		Built from scratch on a custom build
Analytics, Ads conversions, cookie consent	2–4		
Technical SEO and 301 redirects	3–6		More if the domain changes
Testing and fixes (about 20%)	25–43		Cross-browser, phone, accessibility, payments
Total	**150–255**		

How to read a developer's estimate

- Far below the low end (for example "4 to 6 weeks for everything"): ask which lines are missing. Usually the proof flow, production sheet, admin or testing.
- Far above the high end on the builder alone (for example 6 months): push back. The recolouring, placement, rules and pricing logic already work in the prototype.
- A single number with no breakdown: not accepted. Ask for this table filled in.

Acceptance criteria

The build is accepted when every box below is ticked on the staging site and then again on live. A feature is "done" only when its boxes are ticked, not when the code is written.

Pricing

- [ ] 20 reference builds supplied by APE price to the penny on quick quote, builder, basket, checkout and invoice.
- [ ] Changing a price in the browser's developer tools does not change the amount charged.
- [ ] A price table change in admin shows on the site straight away, and an older basket shows the price-changed notice.

Catalogue and quick quote

- [ ] Every launch garment has its page with correct colours, sizes, size chart and prices.
- [ ] Quick quote carries every choice into the builder.
- [ ] A build above the threshold shows no checkout and offers the hand-priced route.

Builder

- [ ] Every launch garment renders in every offered colour, front and back, with print positions on the fabric.
- [ ] Every blocked option shows its reason; no change ever removes a design without a message.
- [ ] Each artwork warning appears for a test file built to trigger it.
- [ ] PDF, AI and EPS uploads show a preview or the labelled placeholder; originals are downloadable in admin.
- [ ] The whole builder works by keyboard alone and on a 360 px wide phone.

Checkout, orders and accounts

- [ ] Card payment with 3D Secure succeeds; a failed payment keeps the basket.
- [ ] Every paid order has a VAT invoice and a production sheet with originals.
- [ ] A proof can be approved from the email link without signing in; approval is logged with version and time.
- [ ] Changes requested creates a new proof version; the dispatch date moves with approval.
- [ ] Reorder recreates the build at today's prices with the original artwork.
- [ ] All 17 emails fire on their trigger with correct content.

Admin

- [ ] An APE staff member adds a colour, changes a price and moves an order to Dispatched without developer help.
- [ ] Studio role can't see price tables or export customer data.

Tracking, SEO and quality

- [ ] Every analytics event shows in GA4 debug view with correct values; purchase conversions reach Google Ads with order value.
- [ ] No analytics or ad cookies before consent.
- [ ] Every URL in the redirect map returns a single 301 to its target.

- [ ] Core Web Vitals targets met on the 5 main templates on mobile.
- [ ] Accessibility check against WCAG 2.2 AA shows no critical or serious issues.

Developer questionnaire

Developers answer every question in writing before estimating, and their answers become part of the agreement. "We'll figure it out" is not an answer.

A. Platform and architecture

1. Which platform do you recommend (Shopify, WooCommerce, custom), and why, against each of these: a price calculated per build, checkout, accounts, VAT invoices, order admin, garment and price admin?
2. What will be custom code and what is built into the platform? List both.
3. Where does the builder run (a separate app, embedded in the theme), and how does it talk to the pricing engine and the basket?
4. What are the monthly running costs: platform plan, apps or plugins, hosting, file storage, email service?
5. Will any paid app or plugin be critical to the site working? What happens if it's discontinued?

B. Pricing and checkout

6. Where is the price calculated, and how do you stop a changed price in the browser from being charged?
7. How exactly does a builder price get into the checkout on your chosen platform? If Shopify, do we need Plus?
8. How are VAT invoices produced, and do the lines always add up to the total?
9. How will you handle a price change after the proof (extra payment or partial refund)?
10. Which payment provider, which methods (card, Apple Pay, Google Pay), and who holds the account?

C. Builder

11. Have you reviewed the prototype? Which parts will you reuse and which will you rewrite, and why?
12. How will PDF, AI and EPS files be converted for preview? What happens when conversion fails?
13. How is the builder made to work by keyboard and on a 360 px phone?

14. What's your plan to meet the builder speed targets (first garment in 3 s, colour change under 100 ms)?

D. Files and production

15. Where are artwork files stored, are they private, are they virus-scanned, and when are they deleted?
16. Show an example of the production sheet you will generate.
17. How does a new garment get into the builder, how long does it take, and can APE staff do it without you?

E. Admin and content

18. Show or describe the admin screens for price tables, rules, garments and orders. What can APE do without you?
19. How are proofs uploaded, versioned and approved?
20. Which roles and permissions are possible, and is two-factor sign-in supported?

F. Integrations, SEO and tracking

21. How will you implement GA4, Google Ads conversions with order value, and Consent Mode v2?
22. How will you build and test the 301 redirect map from the old site?
23. How will you meet the Core Web Vitals targets on mobile?

G. Process

24. Fill in the Effort estimate table line by line. What is excluded?
25. What is your timeline, split into milestones we can see on a staging site?
26. Will you demo progress every week on staging?
27. How do you test: browsers, devices, accessibility, payments?
28. How do you handle a change request, and how is it priced?

H. Ownership and support

29. Is all code in a repository the client owns, and are all accounts in the client's name?
30. What documentation do you hand over (setup, admin guide, garment guide)?
31. How long is the bug-fix warranty after launch, and what does support cost afterwards?
32. Who else would work on this, and who is our single point of contact?

What developers need from us

- This spec, the final designs with annotations, the prototype, the price tables, the launch garment list with photos, the redirect list, and access to the domain and Google accounts.

Open questions and risks

The biggest risk is late price tables: without them there is no checkout and no launch. The pending decisions are tracked in the Decisions log; the questions below are the ones not yet sent to the client.

Not yet in the client questionnaire

- [ ] Is each style in exactly one collection, or does every style have an equivalent in all three?
- [ ] Which products are quote-only (caps, bags, hi-vis, workwear)?
- [ ] Who updates price tables when supplier prices change, and how often?
- [ ] Do we have written permission to use supplier photos under APE's own garment names?
- [ ] Are garments relabelled, or shipped with supplier neck labels?
- [ ] Delivery: charges, courier, UK only or wider, daily cut-off time?
- [ ] Is the same artwork on two garments charged setup once or twice?
- [ ] How long are artwork and customer data kept after an order?
- [ ] Which CRM and accounting systems (if any) are in use?
- [ ] How many days is an emailed quote valid?

Risks

Risk	Impact	Mitigation
Price tables arrive late or incomplete	No checkout; launch slips	Ask this week; build with example data behind a flag; APE signs off 20 reference builds
Platform can't take a per-build price at checkout	Rework or a costly plan upgrade	Question 7 answered in writing before build starts

Risk	Impact	Mitigation
Domain change done without a redirect plan	Loss of search rankings and Ads quality	SEO lead crawls the old site; full 301 map tested before launch
Supplier photo rights unclear	Photos must be removed after launch	Written permission first, or own photography
Sustainability claims without evidence	Regulator action, reputational damage	Evidence file required in admin before a claim shows
Scope creep during build	Cost and time overrun	Anything not in this spec is a change request with its own estimate
Builder feels slow on older phones	Lower conversion on mobile	Speed targets in acceptance criteria; test on a mid-range Android
Proof approvals stall	Orders stuck, late deliveries	Reminder emails; delivery date moves with approval and says so
Conversion tracking breaks at launch	Google Ads optimises on bad data	Events tested in staging; old and new conversions run side by side for 2 weeks
